

US Macro Data Forecasting Report

[View on TensorFlow.org](#)[Run in Google Colab](#)[View source on GitHub](#)[Download notebook](#)

This is a report on analyzing and forecasting the US macro data using **Recurrent Neural Networks (RNNs)**, **Convolutional Neural Networks (CNNs)** and **Generative Adversarial Networks (GANs)**. The report is:

Part I. Statistical analysis

- Basic manipulation
- Correlation analysis
- Time series analysis with ARIMA

Part II. Deep learning models

- Basic model: single-step, single-feature forecasting with LSTM
- Generalized model: multi-step, multi-feature forecasting with LSTM
- Advanced model: Generative Adversarial Network (GAN) with RNN and CNN.

Part III. Conclusions and Next steps

- Conclusions
- Next steps

Introduction

1. The Notebook

Follow the notebook, we can recreate all the results, notice that

- Upload the `USMacroData.xls` file to the root folder on google colab.
- To navigate better, use the table of contents bottom on the upper-left sidebar.
- **For clarity, all code cells are hidden, double click on the cell to get the code.**
- Change the parameters as indicated in the comments to create more custom outputs.
- All source code can also be found in the project file folder

2. The US Macro dataset

This report uses a [US Macro Dataset](#) provided by the [ADP](#).

Before analyzing the data with codes, we have the following observations.

- This dataset contains **6** different features (the **Inflation**, **Wage**, **Unemployment**, **InterestRate**) about the macro economy of the US.

- Data were collected every 1 month, beginning in **1965-01-01 to 2015-12-01**.
- In total, we have **612 rows (month)** and **6 columns (features)**.

Part I.1 Basic manipulation

Code and examples

basic.py

read the file and show the head

↗

	Month	Inflation	Wage	Unemployment	Consumption	Investment	InterestRate
0	1965-01-01	1.557632	3.200000	4.9	6.972061	12.3	3.9
1	1965-02-01	1.557632	3.600000	5.1	7.811330	13.2	3.9
2	1965-03-01	1.242236	4.000000	4.7	7.828032	18.7	4.0
3	1965-04-01	1.552795	3.585657	4.8	8.477938	9.8	4.0
4	1965-05-01	1.552795	3.968254	4.6	7.139364	10.2	4.1

Basic checks: find null values and fill, set index, etc.

↗ Null values summary:

Inflation0
Wage0
Unemployment0
Consumption0
Investment0
InterestRate0
dtype: int64

	Inflation	Wage	Unemployment	Consumption	Investment	InterestRate
Month						
1965-01-01	1.557632	3.200000	4.9	6.972061	12.3	3.90
1965-02-01	1.557632	3.600000	5.1	7.811330	13.2	3.98
1965-03-01	1.242236	4.000000	4.7	7.828032	18.7	4.04
1965-04-01	1.552795	3.585657	4.8	8.477938	9.8	4.09
1965-05-01	1.552795	3.968254	4.6	7.139364	10.2	4.10

Example: plot the "Inflation" column

↗

Data Analysis

As a high level overview, some distinguishable patterns appear when we plot the data:

- **In the 80's (1979-1989), all features experienced some drastic change**
- The time-series has **seasonality pattern**, for example, **Unemployment** has **long** goes through 1 or 2 major up and downs. We will examine the seasonality more carefully in

Part I.2 Correlation analysis

Though it's indicated that there's no obvious correlation among the 6 features, we compute several **Naive correlation, Pearson correlation, local Pearson correlation, instant** and related statistics in order to

- Test the validity of the assumption (i.e. no two features are apparently correlated).
- Chose source and target features for later model builds.

By doing so, we can get more understanding about the 'quality' and 'inner relations' of the data. If it has explanatory power to the feature that we want to predict (e.g. "Inflation"), then there is no need for learning models. On the other hand, if one feature has higher-than-random correlations to another

the feature and the other as the target. In this case, **to determine which feature leads**, the **Dynamic time wrapping**.

Code and Examples

correlation.py

```
Requirement already satisfied: dtw in /usr/local/lib/python3.6/dist-packages (1.4.0)
Requirement already satisfied: scipy in /usr/local/lib/python3.6/dist-packages (from
Requirement already satisfied: numpy in /usr/local/lib/python3.6/dist-packages (from
```

Example: Naive correlation.

	Inflation	Wage	Unemployment	Consumption	Investment	InterestR
Inflation	1.000000	0.778155	0.191886	0.617820	-0.341421	0.773
Wage	0.778155	1.000000	-0.068529	0.703745	-0.125412	0.647
Unemployment	0.191886	-0.068529	1.000000	-0.097183	-0.038286	-0.027
Consumption	0.617820	0.703745	-0.097183	1.000000	0.203165	0.655
Investment	-0.341421	-0.125412	-0.038286	0.203165	1.000000	-0.234
InterestRate	0.773616	0.647482	-0.027809	0.655305	-0.234573	1.000

Example: Pearson correlation

```
Pandas computed Pearson r: 0.7781551675438367
Scipy computed Pearson r: 0.7781551675438365 and p-value: 2.53137614903759e-125
```

Example: local Pearson correlation

```
>
```

Smiling data and rolling window correlation

Example: instantaneous phase synchronization

Example: dynamic time wrapping

Data analysis

Inspecting the correlations from different angles, we find

- **Inflation and Wage have the highest correlation, 0.778155**, among all the features.
- Inflation, Wage, Consumption and InterestRate show quite high positive correlation, and low negative correlation with Unemployment and Investment.
- **Most features slightly lead the Inflation feature.**
- For the first 30 years, certain feature pairs show **high instantaneous phase synchrony**.

We conclude that

- **The assumption that no two features have apparent correlation is wrong.**
- It's reasonable to **use Inflation as target and the other 5 features as source for forecasting**.

Part I.3 Time series analysis with ARIMA

As we mentioned above, some remarkable patterns (e.g. seasonality pattern) naturally appear in c

- We visualize our data using **time-series decomposition** that allows us to decompos trend, seasonality, and noise.
- We **train an ARIMA (Autoregressive Integrated Moving Average)** n Inflation values. To get optimal output, we first
- Use **grid search** to get the optimal parameters for the ARIMA mode.
- We use **ARIMA diagnostics** to investigate any unusual behavior.

Code and examples

time_series.py

Example: decompose "Consumption" column into trend, seasonal and residual

Time series analysis with ARIMA

Grid search for optimal ARIMA parameters

ARIMA training

ARIMA diadonostics

ARIMA predictions

The Mean Squared Error of our forecasts is 0.004963826636415743

The Root Mean Squared Error of our forecasts is 0.07

ARIMA forecasts

Data Analysis

- Components plot show the obvious seasonality, for example, in every 10 years, the **"Inflation" has a half-year seasonality**.
- The optimal ARIMA parameters for "Inflation" are $(1, 1, 1) \times (0, 0, 1, 12)$
- The ARIMA diagnostics show that the **noise distribution is narrower than the**
- **The one-step ahead forecast captures the overall trend well.**
- As we forecast further out into the future, we become less confident in our values. This is reflected by our model, which grows larger as we move further out into the future.

Part II.1 Basic model: single-step, single-feature forecasting

Recurrent Neural Networks (RNNs) are good fits for time-series analysis because they are designed to capture patterns developing through time.

However, vanilla RNNs have a major disadvantage---the vanishing gradient problem---"the changes are so small, making the network unable to converge to an optimal solution.

LSTM (Long-Short Term Memory) is a variation of vanilla RNNs; it overcomes the vanishing gradient problem by clipping gradients if they exceed some constant bounds.

In this section, we will

- Process the data to fit the LSTM model
- **Build and train the LSTM model for single-step, single-feature prediction (e.g., predict tomorrow's value with only today's values of the other 5 features).**

imports

Test Score: 1.53 RMSE

Data Analysis

We only trained the model for 100 epochs, feel free to modify it to any number as long as we have results we find during the experiments

- LSTM with Adam or RMSprop optimizers work better than the SGD optimizer in this project.
- Each model fits the training dataset very well.
- **The prediction captures the range and characteristics of the real data**
- **The model doesn't predict the rapid increasing near the 100th test data**

Part II.2 Generalized model: multi-step, multi-fea

We build a multi-step, multi-feature LSTM model in this section. That means we can use several-d features in the future.

For example, we can use last 12-month's data of Wage, Consumption, In
. In this section, we

- Process the data to fit the requirements of all possible multi-step, multi-feature prediction ta
- We modify the LSTM model accordingly.
- Plot the 3-month prediction for Inflation and Unemployment with last 12-month's data of Wa

Data preparation

Make the data forms are all correct

```
↳ (418, 12, 4)
   (418, 6)
   (180, 12, 4)
   (418, 6)
```

Scaling, vectorize and de_vectorize

Multi-step LSTM model, change the input_shape and Dense layer parameter to

Train the model. Change the optimizer parameter to use other optimizers, e.g.

```
↳
```

Train on 418 samples, validate on 180 samples
